

Chatbot Widget (MMC Policy Assistant)

Code Working (Documentation)

CB_SYSTEM:

A hardcoded system prompt that tells Claude to act as an HR policy assistant for **Mega Motor Company** (BYD Pakistan distributor).

It contains all the actual policy content. This is what the bot knows by default.

SharePoint Integration: (SP_CONFIG + load From Share Point)

The code tries to upgrade the bot's knowledge by pulling real HR documents from a SharePoint folder.

Flow:

1. Fetches an OAuth2 token from Azure AD using client credentials
2. Uses Microsoft Graph API to find the SharePoint site
3. Lists files in the configured folder
4. Downloads each file's text
5. Replaces the hardcoded system prompt with the actual document content

If SharePoint fails for any reason, it silently falls back to the hardcoded policies. Nothing breaks.

UI Functions:

cbToggle() — Opens/closes the chat.

windowcbSubmit() — Handles the send button / Enter.

keycbSend() — Core function — adds message, calls API, renders.

replycbAddMsg() — Renders a user or bot message.

bubblecbAddTyping() — Shows the placeholder "..." while waiting.

waitingcbShowKeySetup() — UI for entering an API key (mostly unused now).

The API Call:

Every message sends the last 10 turns of conversation to api.anthropic.com/v1/messages with the active system prompt (either built-in or SharePoint-loaded).
