

SCOPE OF WORK

Claims Management System Platform

MVP Phase

Version 1.0
September 2026

1. Product Overview & Motivation

The Claims Management Platform is a web-based product designed to replace manual, email-driven claim submission with a structured, trackable online process. Employees across the organization currently raise claims and requests through informal channels; emails, printed forms, or verbal requests; which are hard to track, easy to lose, and offer no visibility into approval status.

This document defines the Scope of Work for the MVP (Minimum Viable Product) phase of the platform, delivered as a Product-as-a-Service web application. The MVP focuses on the essential, end-to-end journey of a claim: a User logs a claim, and an Admin reviews it, approves or rejects it, and allocates the approved claim to the correct department for action.

The motivation for the MVP is to validate this core workflow quickly, with a lean feature set, before investing in the more advanced capabilities described in the full platform vision (such as a configurable form builder and a multi-level approval workflow engine). The platform integrates with Microsoft Entra ID and Microsoft Graph API so that user identity, designation, and department are always aligned with the organization's existing directory.

2. Interface

The MVP includes with two primary interface: a Claimant Portal, where employees create and track claims, and an Admin Portal, where administrators review, decide on, and allocate claims. Representative screens are shown below.

2.1 Sign-In & Access

Users and Admins sign in using their existing Microsoft organizational account via Microsoft Entra ID. No separate username or password is required for the claims system.

2.2 Create Claim (Claimant Portal)

The claimant selects a claim type, fills in the required details, and uploads supporting documents before submitting the claim for approval.

Figure 1: Claimant selecting a claim/request type when creating a new claim.

2.3 My Claims (Claimant Portal)

Claimants can see every claim they have submitted, along with its current stage, status, amount, and submission date.

My Claims
Manage and track all submitted claims.

Generate Report

Figure 3: Admin view of all claims submitted across the organization.

2.5 Claim Review, Approval & Department Allocation (Admin Portal)

When an Admin opens a claim, they can review the claim details, line items and supporting documents, then approve or reject the claim and allocate it to the concerned department.

Figure 4: Admin claim review screen with approve/reject actions.

2.6 Access Control (Admin Portal)

A simplified access view lets the Admin confirm designations and permissions sourced from the organization's directory.

Figure 5: Roles overview, sourced from the organizational directory.

2.7 Audit Log (Admin Portal)

Every key action — claim creation, document upload, approval, rejection and allocation — is recorded in an audit log for accountability.

Figure 7: Configurable Approval Matrix — reference for a future phase, not part of the MVP.

3. Project Objectives

- Provide a simple, guided way for employees to log a claim online instead of manual, paper-based or email-based submission.
- Give administrators a single place to review, approve, reject and allocate incoming claims.
- Ensure every claim reaches the correct department quickly after approval, reducing delays caused by manual hand-offs.
- Establish Microsoft Entra ID as the single source of identity, so access and department information stay consistent with the organization's directory.

- Create a foundation (data model, workflow, audit trail) that can be extended in later phases into the full configurable claims platform.

4. Functional Requirements with User Stories

The functional requirements for the MVP are expressed below as simple user stories, grouped by area and presented in the sequence a claim naturally follows: login, claim submission by the User, and review/allocation by the Admin.

4.1 Login & Authentication

- As a User, I want to log in using my organizational Microsoft account, so that I can securely access the claims system without a separate password.
- As a User, I want the system to recognize whether I am a Claimant or an Admin based on my Microsoft Entra ID profile, so that I automatically see the right portal and options.

4.2 User (Claimant) Functional Requirements

- As a User, I want to create and submit a new claim with the required details and supporting documents, so that I can request approval for my claim.
- As a User, I want to save a claim as a draft before final submission, so that I can complete it later without losing my progress.
- As a User, I want to view a list of my submitted claims with their current status, so that I can track the progress of each request.
- As a User, I want to receive an email notification when the status of my claim changes, so that I stay informed without repeatedly checking the portal.

4.3 Admin Functional Requirements

- As an Admin, I want to view all claims submitted across the organization, so that I can manage and process pending requests.
- As an Admin, I want to open a claim and review its details and attached documents, so that I can make an informed decision.
- As an Admin, I want to approve or reject a submitted claim, so that only valid claims move forward in the process.
- As an Admin, I want to allocate an approved claim to the concerned department, so that the right team can take ownership and action it.
- As an Admin, I want to add a mandatory comment when rejecting a claim, so that the claimant understands the reason for rejection.
- As an Admin, I want the claimant's and approver's designation and department to be fetched automatically from Microsoft Entra ID, so that claim routing reflects the correct organizational structure without manual data entry.
- As an Admin, I want to view an audit log of key actions performed on claims, so that I can maintain accountability and traceability.

4.4 Generic & Configurable Form & Document Builder

Purpose: To design a generic, configurable, and scalable form builder that enables the creation of any business form, claim, request, or ticketing workflow through configuration rather than development effort. Admins define the required form fields and rules, and the system dynamically generates the corresponding user interface and document structure.

Supported Components:

- Text Fields
- Radio Buttons
- Checkboxes
- Dropdown Lists with configurable options

- Date Pickers
- Nested/Repetitive Detail Sections (Array Fields)
- Document Upload Categories
- Dynamic Validation Rules
- Email Format Validation
- Additional Detail Sections

User Stories:

- As an Admin, I want to configure a new claim, request, or ticketing form by defining its fields and rules, so that any business form can be created through configuration rather than development effort.
- As an Admin, I want to add text fields, radio buttons, checkboxes, and dropdown lists with configurable options to a form, so that I can capture the exact information each claim type requires.
- As an Admin, I want to add date picker fields to a form, so that users can enter dates in a consistent, validated format.
- As an Admin, I want to add nested or repetitive detail sections (array fields) to a form, so that users can enter multiple line items, such as several expense entries, within a single claim.
- As an Admin, I want to define required document upload categories for a claim type, so that users must attach the correct supporting documents before they can submit.
- As an Admin, I want to apply dynamic validation rules and email format validation to form fields, so that the data submitted by users is accurate and consistent.
- As an Admin, I want to add additional detail sections to a form, so that I can capture supplementary information beyond the standard fields.
- As a User, I want the claim form to be generated dynamically based on the claim/request type I select, so that I only see the fields and documents relevant to my claim.

The screenshot displays the 'Workflow Configuration' interface. On the left is a dark sidebar with a navigation menu containing: 'CLAIMS' (with sub-items 'Create Claim', 'My Claim', 'All Claims', 'Dashboard'), 'REPORTS' (with 'Claim Reports', 'Audit Log'), 'ACCESS CONTROL' (with 'Roles & Assignments'), 'FORM BUILDER' (with 'Workflow Configuration' highlighted), and 'LOGOUT' (with 'Sign Out'). The main content area is titled 'Workflow Configuration' and has two tabs: 'Generic Form Builder' (active) and 'Approval Matrix'. Below the tabs is a section 'Edit Claim Type/Request Ticketing Form'. It includes a dropdown for 'Load existing claim/request type' set to 'Expense Claim Form (EXPENSE_CLAIM_FORM)', a '+ Start New Instance' button, and input fields for 'Claim Type/Request Name' and 'Expense Claim Form'. Below this is a list of form fields under the heading 'Row 1'. Each field is a card with a 'Label', a 'Type' dropdown, an input field, and a 'Remove This Field' button. The fields are: 'Employee Id' (Type: Number), 'Claimant's Name' (Type: Text), 'Department' (Type: Text), and 'Date' (Type: Date). A 'Remove Row' button is located at the top right of the field list.

Figure 8: Admin configuring a claim/request form by adding labeled fields and types.

5. Tech Stack

The application is delivered as a Product-as-a-Service web application, built on the following stack:

Layer	Technology
Front End	Angular (Single Page Application) for the Claimant Portal and Admin Portal
Back End	Node.js (REST API services) for business logic, claim processing and approval routing
Authentication	Microsoft Entra ID (OAuth 2.0 / OpenID Connect) for organizational sign-in
Directory Data	Microsoft Graph API for retrieving user profile, designation and department information

6. Third-Party Integrations

Integration	Purpose in MVP
Microsoft Entra ID	Single sign-on for Users and Admins, eliminating separate credentials for the claims system
Microsoft Graph API	Fetching the logged-in user's name, email, designation and department to support claim submission and department allocation
Email Notifications	Notifying claimants and department contacts when a claim is approved, rejected or allocated

7. Out of Scope (MVP Phase)

The following capabilities are part of the broader platform vision but are explicitly excluded from this MVP phase and may be considered for future releases:

- AI-powered analytics or dashboards for claims trends.
- Machine Learning based classification of claims into major or minor severity.
- Multi-level, multi-department configurable Approval Matrix / Workflow Engine (the MVP supports a single Admin review and department allocation step).
- Custom Roles & Permission Assignment editor screen (role handling in the MVP relies on basic Admin / Claimant access, informed by Entra ID).
- Advanced claim reporting and exportable analytics beyond a basic claims list and audit log.

8. Project Outcome

By the end of the MVP phase, the following outcomes will be delivered:

- A working web application where employees can log in with their Microsoft account and submit a claim in a few guided steps.
- An Admin Portal where the claims team can see every submitted claim, open it, approve or reject it, and allocate approved claims to the correct department.
- Automatic email notifications so claimants and departments are informed without manual follow-up.

- A basic audit trail of claim actions for accountability.
- A stable, well-structured MVP that validates the core claim-to-approval-to-department workflow and can be extended with the Form Builder, Approval Matrix, and Roles & Permissions modules in a later phase.
